

**ADDENDUM #1**

**2025 STREET REHABILITATION UNIT 1 – KATE SMITH NEIGHBORHOOD**

**PHASE 2 – FEDERALLY FUNDED**

**BID # 24/25-016 / PWP # WA-2025-358**

**BIDS DUE NO LATER THAN: 1:45 PM ON MAY 28, 2025**

**PUBLIC BID OPENING: 2:00 PM ON MAY 28, 2025**

This addendum is to notify all potential proposers of clarifications made to the Bid documents as stated below.

**A) Geotechnical Investigation Reports Titled (Total of 3 separate reports):**

- a. City of Sparks FY25 Unit 1 Dated February 2024 by Lumos & Associates, Inc.**
- b. City of Sparks FY24 Unit 2 Dated February 2024 by Lumos & Associates, Inc.**
- c. City of Sparks FY25 Street Rehabilitation Dated November 2024 by Lumos & Associates, Inc.**

Please note and adjust your bid according to the revisions, additions, deletions, clarifications, or modifications as presented on this Addendum #1, which are made a part of this bid. NOTE: To avoid disqualification, this Addendum 1 (and any other addenda) must be signed by an authorized representative of the bidding firm in the space provided and must be submitted with your firm's sealed proposal. Failure to return this addendum, duly signed, may be cause for rejection of the bid. ALL ADDENDA SHOULD BE SIGNED AND PLACED IN SEQUENTIAL ORDER AND ATTACHED TO THE FRONT OF THE BID PACKAGE, COMPLETE WITH ALL REQUIRED DOCUMENTS.

## **1.0 INTRODUCTION**

This report presents the results of Lumos & Associates, Inc.'s Geotechnical Analysis for the proposed roadway rehabilitation project located in Sparks, NV. A vicinity map is included as Plate 1 and a site map is included as Plate 2.

It is our understanding that the proposed project will consist of roadway reconstruction. Roadway reconstruction operations include asphalt pavement replacement and roadbed modification on the existing asphalt, aggregate base, and/or underlying soils. Plate 2 shows the project streets scheduled for reconstruction. We have assumed that final grades at the site will be approximately the same as the existing grades.

The purpose of our investigation was to characterize the site geology and soil conditions, describe the native soils and determine their engineering properties as they relate to the proposed construction. The investigation was also intended to identify possible adverse geologic, soil, and/or water table conditions. However, this study did not include an environmental assessment or an evaluation for soil and/or groundwater contamination at the site.

This report concludes with recommendations for pavement design. In addition, information such as logs of all explorations (Appendix A) and laboratory test data (Appendix B) are provided in this report.

## **2.0 GEOLOGIC SETTING**

The proposed project is located in the northeastern section of the Truckee Meadows, a broad valley bounded on the west by the tall granitic and volcanic peaks of the Sierra Nevada Mountains (Carson Range), and on the east by the by the lower volcanic peaks of the Virginia and Pah Rah Range. Younger volcanic hills also bound the valley on the north and south. Faults bound the valley from the mountains as is typical of the Basin and Range province. Sediments have filled the valley from a number of tributaries and ancestral lakes during the Quaternary period (2 million years ago to present day). The dominant sediment source has been and continues to be, the Truckee River and its ancestral counterparts. Stream deposits were particularly voluminous after glacial periods. Since the end of the last glacial period, some 10,000 years ago, arid erosional forces combined with faulting have been the predominant processes to shape the region. These processes have created large alluvial fans that surround the valley floor of the Truckee Meadows.

In 2011 the near surface geology of the Reno/Sparks area was mapped by Ramelli, Henry, and Walker. Their mapping shows undivided younger and older Tahoe age fluvial deposits (Qrt) and Tioga age fluvial deposits (Qr2) underlie the site. Both of these deposits are Truckee River deposits which generally are comprised of poorly bedded gravels, sands, and fine grained soils. Plate 3 shows their mapping.

### **3.0 SITE CONDITIONS AND FIELD EXPLORATION**

At the time of our investigation the project roadways had been previously paved with asphalt concrete. Where visible, the project streets generally had moderate alligator cracking, moderate surface wear, and moderate block cracking.

The current field investigation included a subsurface exploration. The location of the subsurface explorations were determined by using existing features at the site. Therefore, the approximate location of the subsurface explorations should be considered accurate only to the degree implied by the methods used.

Our subsurface investigation included seven (7) test pits located within the project streets. Test pit explorations were excavated to a maximum depth of five (5) feet below existing grade (b.e.g.). Additionally, seven (7) core hole explorations were conducted within the existing project streets. Core hole explorations were dug to a maximum depth of two (2) feet. The locations of the exploratory excavations within the proposed site are shown on Plate 2. The subsurface soils were continuously logged and visually classified in the field by our Geotechnician in accordance with the Unified Soil Classification System (USCS). Representative soil samples were collected at each material change within the test pit and core hole locations. Soil samples were subsequently transported to our Reno geotechnical laboratory for testing and additional analysis.

The native soils encountered consisted generally of clayey sands (SC), silty sands (SM), poorly graded sand with silt (SP-SM), Silty Gravel (GM), and clayey gravels (GC). Aggregate base was only encountered in six of the fourteen explorations. The direct asphalt supporting material varied between aggregate base, clayey gravel, silty sand, and clayey sand materials. Table 1 on the next page presents the existing pavement sections within the project streets.

**TABLE 1**  
**THICKNESSES OF EXISTING PAVEMENT SECTIONS**

Exploration	Asphalt (inches)	Direct Supporting Layer (inches)	Subgrade	Exploration	Asphalt (inches)	Direct Supporting Layer (inches)	Subgrade
Core #1	2.25	1.75 (Base)	SM	Test Pit #1	2.5	14 (SM)	SC
Core #2	4.5	7.5 (SM)	SM & SP-SM	Test Pit #2	4	8 (SM)	SC & GM
Core #3	3.5	1.75 (Base)	SM & SC	Test Pit #4	4	6 (SM)	GC
Core #4	4	+14 (SM)	-	Test Pit #5	4	4 (Base)	SM & GM
Core #7	5	7 (SC)	SP-SM	Test Pit #6	4.25	10 (GC)	SP-SM
Core #8	4	4 (Base)	SM & GC	Test Pit #7	4.5	6 (Base)	SC
Core #10	4	9 (SM)	SC	Test Pit #8	5	6 (Base)	SM

## 4.0 FIELD AND LABORATORY TEST DATA

Laboratory tests performed on representative samples included sieve analysis (including fines), Atterberg limits, R-value, expansion index, and sulfate content. Much of this data is displayed on the "logs" of the subsurface explorations to facilitate correlation. Field descriptions presented on the logs have been modified, where appropriate, to reflect laboratory test results. The logs of the subsurface explorations are included in Appendix A of this report as Plates A-1 through A-14. A key to the logs, explaining the symbols and nomenclature, is included as Plate A-15.

Individual laboratory test results are presented in Appendix B as Plates B-1 through B-4. Laboratory testing was performed per ASTM standards, except when test procedures are briefly described and no ASTM standard is specifically referenced in the report. Atterberg limits were determined using the dry method of preparation.

**4.1 Analytical Testing:** Western Environmental Testing Laboratory (WET Lab) of Sparks, Nevada conducted the sulfate content laboratory testing. Test results are included (on WET Lab letterhead) in Appendix B on Plate B-4.

Laboratory prepared cement treated pulverized asphalt/base/subgrade compression specimens were compacted and tested. Specimens were comprised of thirty-five percent (35%) pulverized asphalt, fifteen percent (15%) aggregate base, forty percent (40%) silty sand, and ten percent (10%) clayey sand in order to simulate the existing pavement section. Specimen cement contents were 2%, 4%, and 6% by dry weight of the maximum dry density. Cement treated materials compression results are provided in Appendix D.

The soil samples obtained during this investigation will be held in our laboratory for 30 days from the date of this report. The samples may be retained longer at an additional cost to the client or obtained from this office upon request.

## **5.0 DISCUSSION AND RECOMMENDATIONS**

### **5.1 General**

The following recommendations are based upon the construction and our understanding and assumptions of the proposed improvements, as outlined in the introduction of this report, and based on our findings during the field exploration and laboratory testing phases of this project. If changes in the construction project are proposed, they should be presented to Lumos & Associates, Inc. Geotechnical Department, so that the recommendations provided herein can be reviewed and modified as necessary. As a minimum, final construction drawings should be submitted to the Lumos Geotechnical Department for review prior to actual construction and verification that our geotechnical design recommendations have been implemented.

### **5.2 General Site Grading**

#### **5.2.1 Clearing and Grubbing**

Prior to placement of fill and/or the proposed improvements, the areas to receive fill and/or improvements shall be cleared and grubbed. Clearing and grubbing is not anticipated under the existing roadway. Clearing and grubbing may be required if improvements will be placed outside of the existing roadway. Where required, clearing and grubbing is anticipated to be as much as six (6) inches, or more, where thicker vegetation/roots are present.

Root- or organic-laden soils encountered during excavations, should be stockpiled in a designated area on site for later use in landscaping, or removed off site as directed by the owner. Excavated soils free from any organics, debris or otherwise unsuitable material and with particles no larger than four (4) inches in maximum dimension may be stockpiled and moisture conditioned for later use as compacted fill provided it meets the criteria for structural fill soils.

Exposed excavation surfaces to support any of the proposed improvements should be observed and approved by a Lumos representative. Upon re-compaction and prior to placing any fill, the re-compacted surface should be proof-rolled to identify any possible yielding surfaces. Proof-rolling should be conducted with a heavy rubber-tire loader with a fully loaded bucket, or a fully loaded water truck, and observed and approved by a Lumos representative.

### 5.2.2 Unsuitable Subgrade Mitigation

Unstable conditions due to yielding and/or pumping soils may be encountered on site. Additionally, the exposed soils may yield or pump under heavy equipment loads or where vibratory equipment draws up water. If yielding or pumping conditions are encountered, the soils should be scarified in place, allowed to dry as necessary and re-compacted, where applicable. Alternatively, the unsuitable or saturated soil should be removed, the exposed surface leveled and compacted/tamped as much as practical without causing further pumping, and covered (including the sides) with geotextile stabilizing fabric (Mirafi HP370 or other equivalent). The fabric should then be covered with at least twelve (12) inches of four (4) to six (6) inch **angular rock fill** with enough fines to fill the inter-rock pore spaces. Placement should be by end dumping. No traffic or other action should be allowed over the fabric, which may cause it to deflect/deform prior to cobble placement. Test sections should be used to determine the minimum thickness and/or number of layers required for stabilization.

Stabilization should be evaluated by proof-rolling standards commensurate with the equipment used, and approved by a Lumos representative. The placement of the stabilizing rock-fill may require additional over-excavation to maintain appropriate grading elevations. A filter fabric (Mirafi 180N or equal) should also be placed over the cobble rock fill to prevent piping of fines from covering soils into the stabilizing rock matrix.

### 5.2.3 Structural Fill

Properly compacted structural fill soils to be used on site should consist of non-expansive materials (LL less than 35 and/or a PI less than 12 and/or Expansion Index less than 20), have an R-Value of at least 30, should be free of contaminants, organics (less than two percent (2%)), rubble, or natural rock larger than three inches in largest dimension. All structural fill soils shall also be non-corrosive and have a water soluble sulfate content of less than 0.1%. Structural fill soils shall also meet the following gradation requirements (Table 1):

**TABLE 2  
STRUCTURAL FILL BACKFILL GRADATION**

<b>Sieve Size</b>	<b>% Passing</b>
4"	100
¾"	70 - 100
#40	15 - 65
#200	5 – 35

Import structural fill soils should be tested and approved prior to being placed or delivered on-site (**seven day advanced notice**).

Prior to placement of structural fill, the site subgrade shall be scarified to a depth of twelve (12) inches, moisture conditioned to within two percent (2%) of optimum, and re-compacted to a minimum of **ninety percent (90%)** as determined by the ASTM D1557 Standard.

Structural fill should be placed only on compacted sub-grade or on compacted fill in loose lifts not exceeding eight (8) inches, moisture conditioned to within two percent (2%) of optimum, and compacted to at least **ninety percent (90%)** relative compaction as determined by the ASTM D1557 Standard. Lift thickness may be increased, at the discretion of the Geotechnical Engineer, provided the contractor can demonstrate that adequate compaction is being achieved.

Fill material should not be placed, spread or compacted while the ground is frozen or during unfavorable weather conditions. When site grading is interrupted by heavy rain or snow, grading or filling operations should not resume until a Lumos representative approves the moisture content and density conditions of the subgrade or previously placed fill.

Landscape areas should be cleared of all objectionable material. In cut areas, no other work is necessary except grading to proper elevation. In landscape areas, fill should be placed in loose lifts not exceeding eight inches and compacted to at least **ninety percent (90%)** relative compaction to prevent erosion.

Water should not be allowed to pond on pavements or adjacent to structures, and measures should be taken to reduce surface water infiltration into the subgrade soils. A representative of Lumos should be present during site grading operations to ensure any unforeseen or concealed conditions within the site are identified and properly mitigated, and to test and observe earthwork construction. This testing and observation is an integral part of our service as acceptance of earthwork construction is dependent upon compaction and stability of the subgrade soils. The soils engineer may reject any material that does not meet engineering characteristics, compaction, and stability requirements. Further, recommendations of this report are based upon the assumption that earthwork construction will conform to recommendations set forth in this section of the report.

## 6.0 PAVEMENT DESIGN

### 6.1 Pulverization, Cement Treatment, and Asphalt Concrete

Lumos recommends pulverizing the existing asphalt, aggregate base, and/or subgrade soils to a depth of twelve (12) inches. The pavement structural section was determined for the asphalt concrete utilizing a resistance value (R-Value) of 3 (Native Clayey Gravel with Sand) and an R-Value of 80 for the cement treated recycled aggregate base. For this project, we have assumed a Traffic Index (TI) value of 5 due to the anticipated low traffic volume. Refer to Table 3 for the recommended asphalt pavement section. The pulverized material shall meet the gradation requirements of Type 1 Recycled Aggregate Base. The pulverized material shall be regraded to accommodate four (4) inches of asphalt. The remaining eight (8) inches of pulverized material shall be cement treated. The regraded pulverized material shall be moisture conditioned to at least two percent (2%) over optimum, six and one-half percent (6.5%) cement added by dry weight of aggregate, and compacted to a minimum of **ninety-five percent (95%)** relative density of the ASTM D1557 standard. The compacted cement treated pulverized material shall be sealed with a coat of CSS applied at a rate of between 0.15 gallons to 0.25 gallon per square yard within twenty-four (24) hours of compaction. The cement treated pulverized material shall be kept moist until the cure seal is placed. Following placement of the cure the prepared material shall be allowed to cure for a minimum of seven (7) days and reach a compressive strength of at least three-hundred pounds per square inch (300 psi) prior to paving. Immediately prior to paving, the cement treated pulverized materials shall be "microcracked", utilizing a vibratory roller. Microcracking shall be completed prior to paving and to the satisfaction of the Geotechnical Engineer. See Appendix C and D for the Pavement Calculations and Cement Treated Specimen Compression Test Data.

**TABLE 3**  
**PULVERIZATION REQUIREMENTS AND PAVEMENT STRUCTURAL SECTION**

TRAFFIC INDEX	PULVERIZATION DEPTH	CEMENT TREATED RECYCLED BASE THICKNESS	ASPHALT THICKNESS
5	12"	8"	4"

We recommend a Type III, PG64-28NV, 50 blow Marshall mix targeting three percent (3%) air voids. The asphalt concrete shall be compacted to between ninety-three percent (93%) and ninety-eight percent (98%) of the theoretical maximum ("Rice") specific gravity.

## 7.0 CORROSION AND CHEMICAL ATTACK

Tested soils have a mild sulfate content of 150 parts per million. However, Type II cement (meeting ASTM C150) is recommended for all concrete and cement in direct contact with on-site soil.

All exterior concrete should have between four and one half and seven and one-half percent (4.5%-7.5%) entrained air, a maximum water-cement ratio of 0.45 and comply with all other ACI recommendations for concrete placed in areas subject to freezing. A minimum compressive strength of 4,000 psi is recommended for all external concrete. All concrete shall be placed pursuant to ACI recommendations.

## **8.0 MOISTURE PROTECTION, EROSION AND DRAINAGE**

The finish surfaces around all structures should slope away from the foundations and toward appropriate drop inlets or other surface drainage devices. It is recommended that within ten feet of any structure a minimum slope of five percent (5%) be used for soil subgrade and a minimum of one percent (1%) be used for pavement. These grades should be maintained for the life of the structures.

## **9.0 CONSTRUCTION SPECIFICATIONS**

All work shall be governed by the latest adopted revision of the Standard Specifications and Standard Details for Public Works Construction, as distributed by The City of Sparks, except as modified herein.

## **10.0 LIMITATIONS**

This report has been prepared in accordance with the currently accepted engineering practices in Northern Nevada and Northern California. The analysis and recommendations in this report are based upon exploration performed at the locations shown on the site plan, the proposed improvements as described in the Introduction section of this report and upon the property in its condition as of the date of this report. Lumos makes no guarantee as to the continuity of conditions as subsurface variations may occur between or beyond exploration points and over time. Any subsurface variations encountered during construction should be immediately reported to Lumos so that, if necessary, Lumos' recommendations may be modified.

This report has been prepared for and provided directly to The City of Sparks ("The Client"), and any and all use of this report is expressly limited to the exclusive use of the Client. The Client is responsible for determining who, if anyone, shall be provided this report, including any designers and subcontractors whose work is related to this project. Should the Client decide to provide this report to any other individual or entity, Lumos shall not be held liable for any use by those individuals or entities to whom this report is provided. The Client agrees to indemnify, defend and hold harmless Lumos, its agents and employees from any claims resulting from unauthorized users.

If this report is utilized in the preparation of an Engineer's Estimate of Probable Construction Costs, then the preparer of the estimate acknowledges that the report recommendations are based on the subsurface conditions found at the specific locations investigated on site; that subsurface conditions may vary outside these locations; and that no guaranty or warranty, express or implied, is made that the conditions encountered are representative of the entire site. The preparer of the estimate agrees to indemnify, defend and hold harmless Lumos & Associates, its agents and employees from any and all claims, causes of action or liability arising from any claims resulting from the use of the report in the preparation of an Engineer's Cost Estimate.

## GEOTECHNICAL INVESTIGATION REPORT

This report is not intended for, nor should be utilized for, bidding purposes. If it is utilized for bidding purposes, Client acknowledges that the report recommendations are based on the subsurface conditions found at the specific locations investigated on site; that subsurface conditions may vary outside these locations; and that no guaranty or warranty, express or implied, is made that the conditions encountered are representative of the entire site. The Client agrees to indemnify, defend and hold harmless Lumos & Associates, Inc., its agents and employees from any and all claims, causes or action or liability arising from any claims resulting from the use of the report for bidding purposes.

As explained above, subsurface variations may exist and as such, beyond the express findings located in this report, no warranties express, or implied, are made by this report. No affirmation of fact, including but not limited to statements regarding suitability for use of performance shall be deemed to be a warranty or guaranty for any purpose.

## **1.0 INTRODUCTION**

This report presents the results of Lumos & Associates, Inc.'s Geotechnical Analysis for the proposed roadway rehabilitation project located in Sparks, NV. A vicinity map is included as Plate 1 and a site map is included as Plate 2.

It is our understanding that the proposed project will consist of roadway reconstruction. Roadway reconstruction operations include asphalt pavement replacement and roadbed modification on the existing asphalt, aggregate base, and/or underlying soils. Plate 2 shows the project streets scheduled for reconstruction. We have assumed that final grades at the site will be approximately the same as the existing grades.

The purpose of our investigation was to characterize the site geology and soil conditions, describe the native soils and determine their engineering properties as they relate to the proposed construction. The investigation was also intended to identify possible adverse geologic, soil, and/or water table conditions. However, this study did not include an environmental assessment or an evaluation for soil and/or groundwater contamination at the site.

This report concludes with recommendations for pavement design. In addition, information such as logs of all explorations (Appendix A) and laboratory test data (Appendix B) are provided in this report.

## 2.0 GEOLOGIC SETTING

The proposed project is located in the northeastern section of the Truckee Meadows, a broad valley bounded on the west by the tall granitic and volcanic peaks of the Sierra Nevada Mountains (Carson Range), and on the east by the by the lower volcanic peaks of the Virginia and Pah Rah Range. Younger volcanic hills also bound the valley on the north and south. Faults bound the valley from the mountains as is typical of the Basin and Range province. Sediments have filled the valley from a number of tributaries and ancestral lakes during the Quaternary period (2 million years ago to present day). The dominant sediment source has been and continues to be, the Truckee River and its ancestral counterparts. Stream deposits were particularly voluminous after glacial periods. Since the end of the last glacial period, some 10,000 years ago, arid erosional forces combined with faulting have been the predominant processes to shape the region. These processes have created large alluvial fans that surround the valley floor of the Truckee Meadows.

In 2011 the near surface geology of the Reno/Sparks area was mapped by Ramelli, Henry, and Walker. Their mapping shows undivided younger and older Tahoe age fluvial deposits (Qrt) and Tioga age fluvial deposits (Qr2) underlie the site. Both of these deposits are Truckee River deposits which generally are comprised of poorly bedded gravels, sands, and fine grained soils. Plate 3 shows their mapping.

### **3.0 SITE CONDITIONS AND FIELD EXPLORATION**

At the time of our investigation the project roadways had been previously paved with asphalt concrete. Where visible, the project streets generally had moderate alligator cracking, moderate surface wear, and moderate block cracking.

The current field investigation included a subsurface exploration. The location of the subsurface explorations were determined by using existing features at the site. Therefore, the approximate location of the subsurface explorations should be considered accurate only to the degree implied by the methods used.

Our subsurface investigation included two (2) test pits located within the project streets. Test pit explorations were excavated to a maximum depth of four and one half (4.5) feet below existing grade (b.e.g.). Additionally, three (3) core hole explorations were conducted within the existing project streets. Core hole explorations were dug to a maximum depth of two (2) feet. The locations of the exploratory excavations within the proposed site are shown on Plate 2. The subsurface soils were continuously logged and visually classified in the field by our Geotechnician in accordance with the Unified Soil Classification System (USCS). Representative soil samples were collected at each material change within the test pit and core hole locations. Soil samples were subsequently transported to our Reno geotechnical laboratory for testing and additional analysis.

The native soils encountered consisted generally of clayey sands (SC), silty sands (SM), and poorly graded gravels with clay (GP-GC). Aggregate base was only encountered in four of the five explorations. Table 1 presents the existing pavement sections within the project streets.

**TABLE 1  
THICKNESSES OF EXISTING PAVEMENT SECTIONS**

<b>Exploration</b>	<b>Asphalt (inches)</b>	<b>Direct Supporting Layer (inches)</b>	<b>Subgrade</b>	<b>Exploration</b>	<b>Asphalt (inches)</b>	<b>Direct Supporting Layer (inches)</b>	<b>Subgrade</b>
Core #5	3	5 (Base)	SM & SC	Test Pit #3	5	7 (Base)	GP-GC
Core #6	4	4 (SM)	SM & SC	Test Pit #9	4.5	5 (Base)	GP-GC
Core #9	5	2 (Base)	SC & SM	-	-	-	-

## 4.0 FIELD AND LABORATORY TEST DATA

Laboratory tests performed on representative samples included sieve analysis (including fines), Atterberg limits, R-value, expansion index, and sulfate content. Much of this data is displayed on the "logs" of the subsurface explorations to facilitate correlation. Field descriptions presented on the logs have been modified, where appropriate, to reflect laboratory test results. The logs of the subsurface explorations are included in Appendix A of this report as Plates A-1 through A-5. A key to the logs, explaining the symbols and nomenclature, is included as Plate A-6.

Individual laboratory test results are presented in Appendix B as Plates B-1 through B-4. Laboratory testing was performed per ASTM standards, except when test procedures are briefly described and no ASTM standard is specifically referenced in the report. Atterberg limits were determined using the dry method of preparation.

**4.1 Analytical Testing:** Western Environmental Testing Laboratory (WET Lab) of Sparks, Nevada conducted the sulfate content laboratory testing. Test results are included (on WET Lab letterhead) in Appendix B on Plate B-4.

Laboratory prepared cement treated pulverized asphalt/base/subgrade compression specimens were compacted and tested. Specimens were comprised of thirty-five percent (35%) pulverized asphalt, thirty percent (30%) aggregate base, twenty-five percent (25%) silty sand, and ten percent (10%) clayey sand in order to simulate the existing pavement section. Specimen cement contents were 2%, 4%, and 6% by dry weight of the maximum dry density. Cement treated materials compression results are provided in Appendix D.

The soil samples obtained during this investigation will be held in our laboratory for 30 days from the date of this report. The samples may be retained longer at an additional cost to the client or obtained from this office upon request.

## **5.0 DISCUSSION AND RECOMMENDATIONS**

### **5.1 General**

The following recommendations are based upon the construction and our understanding and assumptions of the proposed improvements, as outlined in the introduction of this report, and based on our findings during the field exploration and laboratory testing phases of this project. If changes in the construction project are proposed, they should be presented to Lumos & Associates, Inc. Geotechnical Department, so that the recommendations provided herein can be reviewed and modified as necessary. As a minimum, final construction drawings should be submitted to the Lumos Geotechnical Department for review prior to actual construction and verification that our geotechnical design recommendations have been implemented.

### **5.2 General Site Grading**

#### **5.2.1 Clearing and Grubbing**

Prior to placement of fill and/or the proposed improvements, the areas to receive fill and/or improvements shall be cleared and grubbed. Clearing and grubbing is not anticipated under the existing roadway. Clearing and grubbing may be required if improvements will be placed outside of the existing roadway. Where required, clearing and grubbing is anticipated to be as much as six (6) inches, or more, where thicker vegetation/roots are present.

Root- or organic-laden soils encountered during excavations, should be stockpiled in a designated area on site for later use in landscaping, or removed off site as directed by the owner. Excavated soils free from any organics, debris or otherwise unsuitable material and with particles no larger than four (4) inches in maximum dimension may be stockpiled and moisture conditioned for later use as compacted fill provided it meets the criteria for structural fill soils.

Exposed excavation surfaces to support any of the proposed improvements should be observed and approved by a Lumos representative. Upon re-compaction and prior to placing any fill, the re-compacted surface should be proof-rolled to identify any possible yielding surfaces. Proof-rolling should be conducted with a heavy rubber-tire loader with a fully loaded bucket, or a fully loaded water truck, and observed and approved by a Lumos representative.

### 5.2.2 Unsuitable Subgrade Mitigation

Unstable conditions due to yielding and/or pumping soils may be encountered on site. Additionally, the exposed soils may yield or pump under heavy equipment loads or where vibratory equipment draws up water. If yielding or pumping conditions are encountered, the soils should be scarified in place, allowed to dry as necessary and re-compacted, where applicable. Alternatively, the unsuitable or saturated soil should be removed, the exposed surface leveled and compacted/tamped as much as practical without causing further pumping, and covered (including the sides) with geotextile stabilizing fabric (Mirafi HP370 or other equivalent). The fabric should then be covered with at least twelve (12) inches of four (4) to six (6) inch **angular rock fill** with enough fines to fill the inter-rock pore spaces. Placement should be by end dumping. No traffic or other action should be allowed over the fabric, which may cause it to deflect/deform prior to cobble placement. Test sections should be used to determine the minimum thickness and/or number of layers required for stabilization.

Stabilization should be evaluated by proof-rolling standards commensurate with the equipment used, and approved by a Lumos representative. The placement of the stabilizing rock-fill may require additional over-excavation to maintain appropriate grading elevations. A filter fabric (Mirafi 180N or equal) should also be placed over the cobble rock fill to prevent piping of fines from covering soils into the stabilizing rock matrix.

### 5.2.3 Structural Fill

Properly compacted structural fill soils to be used on site should consist of non-expansive materials (LL less than 35 and/or a PI less than 12 and/or Expansion Index less than 20), have an R-Value of at least 30, should be free of contaminants, organics (less than two percent (2%)), rubble, or natural rock larger than three inches in largest dimension. All structural fill soils shall also be non-corrosive and have a water soluble sulfate content of less than 0.1%. Structural fill soils shall also meet the following gradation requirements (Table 1):

**TABLE 2  
STRUCTURAL FILL BACKFILL GRADATION**

<b>Sieve Size</b>	<b>% Passing</b>
4"	100
¾"	70 - 100
#40	15 - 65
#200	5 – 35

Import structural fill soils should be tested and approved prior to being placed or delivered on-site (**seven day advanced notice**).

Prior to placement of structural fill, the site subgrade shall be scarified to a depth of twelve (12) inches, moisture conditioned to within two percent (2%) of optimum, and re-compacted to a minimum of **ninety percent (90%)** as determined by the ASTM D1557 Standard.

Structural fill should be placed only on compacted sub-grade or on compacted fill in loose lifts not exceeding eight (8) inches, moisture conditioned to within two percent (2%) of optimum, and compacted to at least **ninety percent (90%)** relative compaction as determined by the ASTM D1557 Standard. Lift thickness may be increased, at the discretion of the Geotechnical Engineer, provided the contractor can demonstrate that adequate compaction is being achieved.

Fill material should not be placed, spread or compacted while the ground is frozen or during unfavorable weather conditions. When site grading is interrupted by heavy rain or snow, grading or filling operations should not resume until a Lumos representative approves the moisture content and density conditions of the subgrade or previously placed fill.

Landscape areas should be cleared of all objectionable material. In cut areas, no other work is necessary except grading to proper elevation. In landscape areas, fill should be placed in loose lifts not exceeding eight inches and compacted to at least **ninety percent (90%)** relative compaction to prevent erosion.

Water should not be allowed to pond on pavements or adjacent to structures, and measures should be taken to reduce surface water infiltration into the subgrade soils. A representative of Lumos should be present during site grading operations to ensure any unforeseen or concealed conditions within the site are identified and properly mitigated, and to test and observe earthwork construction. This testing and observation is an integral part of our service as acceptance of earthwork construction is dependent upon compaction and stability of the subgrade soils. The soils engineer may reject any material that does not meet engineering characteristics, compaction, and stability requirements. Further, recommendations of this report are based upon the assumption that earthwork construction will conform to recommendations set forth in this section of the report.

## 6.0 PAVEMENT DESIGN

### 6.1 Pulverization, Cement Treatment, and Asphalt Concrete

Lumos recommends pulverizing the existing asphalt, aggregate base, and/or subgrade soils to a depth of ten (10) inches. The pavement structural section was determined for the asphalt concrete utilizing a resistance value (R-Value) of 14 (Native Poorly Graded Gravel with Clay and Sand) and an R-Value of 80 for the cement treated recycled aggregate base. For this project, we have assumed a Traffic Index (TI) value of 5 due to the anticipated low traffic volume. Refer to Table 3 for the recommended asphalt pavement section. The pulverized material shall meet the gradation requirements of Type 1 Recycled Aggregate Base. The pulverized material shall be regraded to accommodate four (4) inches of asphalt. The remaining six (6) inches of pulverized material shall be cement treated. The regraded pulverized material shall be moisture conditioned to at least two percent (2%) over optimum, four and one-half percent (4.5%) cement added by dry weight of aggregate, and compacted to a minimum of **ninety-five percent (95%)** relative density of the ASTM D1557 standard. The compacted cement treated pulverized material shall be sealed with a coat of CSS applied at a rate of between 0.15 gallons to 0.25 gallon per square yard within twenty-four (24) hours of compaction. The cement treated pulverized material shall be kept moist until the cure seal is placed. Following placement of the cure the prepared material shall be allowed to cure for a minimum of seven (7) days and reach a compressive strength of at least three-hundred pounds per square inch (300 psi) prior to paving. Immediately prior to paving, the cement treated pulverized materials shall be "microcracked", utilizing a vibratory roller. Microcracking shall be completed prior to paving and to the satisfaction of the Geotechnical Engineer. See Appendix C and D for the Pavement Calculations and Cement Treated Specimen Compression Test Data.

**TABLE 3**  
**PULVERIZATION REQUIREMENTS AND PAVEMENT STRUCTURAL SECTION**

TRAFFIC INDEX	PULVERIZATION DEPTH	CEMENT TREATED RECYCLED BASE THICKNESS	ASPHALT THICKNESS
5	10"	6"	4"

We recommend a Type III, PG64-28NV, 50 blow Marshall mix targeting three percent (3%) air voids. The asphalt concrete shall be compacted to between ninety-three percent (93%) and ninety-eight percent (98%) of the theoretical maximum ("Rice") specific gravity.

## 7.0 CORROSION AND CHEMICAL ATTACK

Tested soils have a mild sulfate content of 23 parts per million. However, Type II cement (meeting ASTM C150) is recommended for all concrete and cement in direct contact with on-site soil.

All exterior concrete should have between four and one half and seven and one-half percent (4.5%-7.5%) entrained air, a maximum water-cement ratio of 0.45 and comply with all other ACI recommendations for concrete placed in areas subject to freezing. A minimum compressive strength of 4,000 psi is recommended for all external concrete. All concrete shall be placed pursuant to ACI recommendations.

## **8.0 MOISTURE PROTECTION, EROSION AND DRAINAGE**

The finish surfaces around all structures should slope away from the foundations and toward appropriate drop inlets or other surface drainage devices. It is recommended that within ten feet of any structure a minimum slope of five percent (5%) be used for soil subgrade and a minimum of one percent (1%) be used for pavement. These grades should be maintained for the life of the structures.

## **9.0 CONSTRUCTION SPECIFICATIONS**

All work shall be governed by the latest adopted revision of the Standard Specifications and Standard Details for Public Works Construction, as distributed by The City of Sparks, except as modified herein.

## 10.0 LIMITATIONS

This report has been prepared in accordance with the currently accepted engineering practices in Northern Nevada and Northern California. The analysis and recommendations in this report are based upon exploration performed at the locations shown on the site plan, the proposed improvements as described in the Introduction section of this report and upon the property in its condition as of the date of this report. Lumos makes no guarantee as to the continuity of conditions as subsurface variations may occur between or beyond exploration points and over time. Any subsurface variations encountered during construction should be immediately reported to Lumos so that, if necessary, Lumos' recommendations may be modified.

This report has been prepared for and provided directly to The City of Sparks ("The Client"), and any and all use of this report is expressly limited to the exclusive use of the Client. The Client is responsible for determining who, if anyone, shall be provided this report, including any designers and subcontractors whose work is related to this project. Should the Client decide to provide this report to any other individual or entity, Lumos shall not be held liable for any use by those individuals or entities to whom this report is provided. The Client agrees to indemnify, defend and hold harmless Lumos, its agents and employees from any claims resulting from unauthorized users.

If this report is utilized in the preparation of an Engineer's Estimate of Probable Construction Costs, then the preparer of the estimate acknowledges that the report recommendations are based on the subsurface conditions found at the specific locations investigated on site; that subsurface conditions may vary outside these locations; and that no guaranty or warranty, express or implied, is made that the conditions encountered are representative of the entire site. The preparer of the estimate agrees to indemnify, defend and hold harmless Lumos & Associates, its agents and employees from any and all claims, causes of action or liability arising from any claims resulting from the use of the report in the preparation of an Engineer's Cost Estimate.

## GEOTECHNICAL INVESTIGATION REPORT

This report is not intended for, nor should be utilized for, bidding purposes. If it is utilized for bidding purposes, Client acknowledges that the report recommendations are based on the subsurface conditions found at the specific locations investigated on site; that subsurface conditions may vary outside these locations; and that no guaranty or warranty, express or implied, is made that the conditions encountered are representative of the entire site. The Client agrees to indemnify, defend and hold harmless Lumos & Associates, Inc., its agents and employees from any and all claims, causes or action or liability arising from any claims resulting from the use of the report for bidding purposes.

As explained above, subsurface variations may exist and as such, beyond the express findings located in this report, no warranties express, or implied, are made by this report. No affirmation of fact, including but not limited to statements regarding suitability for use of performance shall be deemed to be a warranty or guaranty for any purpose.

## SOIL SULFATE CONTENT

Job Number: 11500.154

Date: January 2024

**PLATE**  
**B-4**

# **APPENDIX C**

## **Pavement Calculations**

Job Number: 11500.154  
Project: City of Sparks FY24 Unit 2 Rehab  
Client: The City of Sparks  
Description: Pavement Calculations  
By: J. Macaluso

R-Value for CTB = 80 (Assumed)  
R-Value for Native Soils = 14  
TI (Local Road) = 5 (Light Traffic)

$$GE = 0.0032 * (TI) * (100 - R)$$

$$Gf_{(AC, Local)} = 2.5, Gf_{(Cement Treated Soil)} = 1.2, Gf_{(subgrade)} = 1$$
$$t_{layer} = GE / Gf$$

**Local Road Pavement Section : Asphalt and Cement Treated Recycled Material**

$$GE_{AC} = 0.0032 * (5) * (100 - 80) = 0.32'$$
$$t_{AC} = (0.32 / 2.5) * (12'' / 1') = 1.54'' \quad \text{USE 4" Asphalt Concrete}$$
$$GE_{AC} = (4'' * 2.5) / (12'') = 0.83'$$

$$GE_{CTB(Pulv.)} = 0.0032 * (5) * (100 - 14) = 1.4'$$
$$t_{CTB(Pulv.)} = ((1.4' - 0.83') / 1.2) * (12'' / 1') = 5.7'' \quad \text{USE 6" Cement Treated Pulverized Material}$$

# GEOTECHNICAL INVESTIGATION REPORT

## CITY OF SPARKS FY25 STREET REHABILITATION SPARKS, NEVADA

### 1.0 INTRODUCTION

This report presents the results of Lumos & Associates, Inc.'s Geotechnical Analysis for the proposed City of Sparks FY25 street rehabilitation project located in Sparks, Nevada. A vicinity map is included as Plate 1 and a site map is included as Plate 2.

It is our understanding that the proposed project will consist of asphalt roadway reconstruction/rehabilitation. The project scope also includes the replacement of associated concrete flatwork. We have assumed that final grades at the site will be approximately the same as the existing grades. This investigation was divided into two components; a new pavement investigation along new FY 25 project streets and collection of additional soil information on previously investigated FY 25 streets. The new FY 25 project streets include I Street and H Street between 19<sup>th</sup> Street and Sullivan Lane and 20<sup>th</sup> Street between F Street and I Street. The previously investigated project streets where additional soil information was collected include F Street between 19<sup>th</sup> Street and 18<sup>th</sup> Street and 19<sup>th</sup> Street between H Street and G Street. The project limits described above are presented on the figure below.

*Figure 1: Project Limits Map*

The purpose of our investigation was to characterize the site geology and soil conditions, describe the native soils and determine their engineering properties as they relate to the proposed construction. The investigation was also intended to identify possible adverse geologic, soil, and/or water table conditions. However, this study did not include an environmental assessment or an evaluation for soil and/or groundwater contamination at the site.

This report concludes with recommendations for site grading and asphalt pavement improvements. In addition, information such as logs of all explorations (Appendix A), laboratory test data (Appendix B), and pulverized cement treated asphalt/base/subgrade compression test reports (Appendix E) are provided in this report.

The recommendations contained herein have been prepared based on our understanding and assumptions of the proposed construction, as outlined above. Re-evaluation of the recommendations presented in this report should be conducted after the final site grading and construction plans are completed, if there are any variations from the assumptions described herein.

It is possible that subsurface discontinuities may exist between and beyond exploration points. Such discontinuities are beyond the evaluation of the Engineer at this time. No guarantee of the consistency of site geology and sub-surface conditions is implied or intended.

## 2.0 GEOLOGIC SETTING

Sparks is located in the western portion of the Great Basin geomorphic province. The Great Basin is characterized by internal drainage and large normal fault-bounded valleys (grabens) separated by high mountain ranges (horst). The Sierra Nevada province to the west is characterized by large granite masses that have been uplifted and tilted a few degrees toward the west. Overlying the granites are older oceanic meta-sedimentary rocks.

More specifically the project streets are located within the eastern half of the Truckee Meadows, a broad valley bounded on the west by the tall granite peaks of the Sierra Nevada Mountains, and on the east by the lower volcanic peaks of the Virginia Range. Younger volcanic rocks also bound the valley on the north and south. Faults separate the valley from the surrounding mountains as is typical of the Basin and Range province. Sediments filled the valley from a number of tributaries and ancestral lakes during the late Tertiary period. The dominant sediment source has been, and continues to be, the Truckee River and its ancestral counterparts. Stream deposits were particularly voluminous after glacial periods. Since the end of the last glacial period, some 10,000 years ago, arid erosional forces combined with faulting have been the predominant processes to shape the region. These processes have created large alluvial fans that surround the valley floor of the Truckee Meadows. The surface geology in this area has been mapped by Alan R. Ramelli, Et al. (2011). Their mapping shows undivided younger and older Tahoe age fluvial deposits (Qrt) and Tioga age fluvial deposits (Qr2) underlie the site. Both of these deposits are Truckee River deposits which generally are comprised of poorly bedded gravels, sands, and fine grained soils. Which is consistent with what was encountered during our field investigation. Their geologic mapping is presented on Plate 3.

### 3.0 SITE CONDITIONS AND FIELD EXPLORATION

At the time of our investigation the site was paved. The pavement is generally in poor condition, with various types of cracking and fatigue stresses observed. Severe alligator cracking and medium severity block cracking and potholes were encountered throughout the project streets. The image below, taken on 19<sup>th</sup> Street, illustrates such pavement stresses.

*Image 1: General Pavement Condition (Condition Shown Similar Throughout Project Streets)*

The current investigation included test pit and asphalt core hole subsurface explorations. Five test pits and two core holes were excavated along the new FY 25 project streets and four core holes were excavated along the previously investigated FY 25 project streets (See Plate 2). The location of the subsurface explorations were determined by using existing features at the site. Therefore, the approximate location of the subsurface explorations should be considered accurate only to the degree implied by the methods used.

The five test pits were excavated to an approximate depth of four (4) to four and one-half (4.5) feet below-existing-grade (b.e.g.) utilizing a Case 590 backhoe. The six core hole explorations were dug to a maximum depth of one and one-half (1.5) feet. The locations of the exploratory test pits and core holes within the site are shown on Plate 2. The subsurface soils were continuously logged and visually classified in the field by our Geotechnician in accordance with the Unified Soil Classification System (USCS). Representative soil samples were collected at each material change within the subsurface explorations and subsequently transported to our Carson City geotechnical laboratory for testing and additional analysis.

The native soils encountered consisted generally of clayey sands (SC), silty sands (SM), clayey gravel (GC) and poorly graded gravels (GP and GP-GM). Cobbles were encountered in four of the five test pit excavations. Generally, cobbles were encountered at depths below two (2) feet, excluding test pit #2 where a cobbles were encountered at ten (10) inches (b.e.g.). Table 1 presents the existing pavement sections encountered during our investigation.

**TABLE 1: EXISTING PAVEMENT SECTIONS AND SUBGRADE DESCRIPTION**

Exploration	Asphalt Thickness (in.)	Base Course Thickness (in.)	Subgrade Material
<b>New FY 25 Project Streets (I St, H St, &amp; 20<sup>th</sup> St)</b>			
TP #1	4	5	Clayey Sand (SC) and Clayey Gravel with Sand and Cobble (GC)
TP #2	5	5	Poorly Graded Gravel with Sand and Cobble (GP)
TP #3	4	5	Clayey Sand (SC) and Poorly Graded Gravel with Silt, Sand, and Cobble (GP-GM)
TP #4	4	8	Clayey Sand with Gravel Fill (SC) and Silty Sand with Gravel (SM)
TP #5	5	6	Clayey Sand with Gravel Fill (SC) and Clayey Gravel with Sand and Cobble (GC)
Core #1	4.25	5.75 Struct. Fill	Clayey Sand with Gravel (SC)
Core #2	4	8	Silty Sand with Gravel (SM)
<b>Previously Investigated FY 25 Streets (F St &amp; 19<sup>th</sup> St)</b>			
Core #3	4	0	Clayey Sand (SC)
Core #4	4	0	Clayey Sand with Gravel (SC)
Core #5	4	0	Silty Sand with Gravel Fill (SM)
Core #6	4	0	Silty Sand with Gravel Fill (SM)

## 4.0 FIELD AND LABORATORY TEST DATA

Field data was developed from samples taken and tests conducted during the field exploration and laboratory testing phases of this project. Representative soil samples were obtained for each material encountered in the exploratory excavations. All the samples were subsequently transported to our Carson City geotechnical laboratory for testing and analysis.

Laboratory tests performed on representative samples included sieve analysis (including fines), Atterberg limits, R-value, expansion index, and soil sulfate content. Much of this data is displayed on the "logs" of the subsurface explorations to facilitate correlation. Field descriptions presented on the logs have been modified, where appropriate, to reflect laboratory test results. The logs of the subsurface explorations are included in Appendix A of this report as Plates A-1 through A-11. A key to the logs is included as Plate A-12.

Individual laboratory test results are presented in Appendix B as Plates B-1 through B-4. Laboratory testing was performed per ASTM standards, except when test procedures are briefly described and no ASTM standard is specifically referenced in the report. Atterberg limits were determined using the dry method of preparation.

**Analytical Testing:** Western Environmental Testing Laboratory (WET Lab) conducted this testing. Analytical testing included determination of the site soil's sulfate content. One sample was delivered to WET Lab's Sparks office. Analytical test results are presented on Plate B-4.

The soil samples obtained during this investigation will be held in our laboratory for 30 days from the date of this report. The samples may be retained longer at an additional cost to the client or obtained from this office upon request.

---

---

## 5.0 DISCUSSION AND RECOMMENDATIONS

---

---

---

### ***5.1 General***

---

From a geotechnical viewpoint, the site is considered suitable for the proposed improvements when prepared as recommended herein.

The following recommendations are based upon the construction and our understanding and assumptions of the proposed improvements, as outlined in the introduction of this report, and based on our findings during the field exploration and laboratory testing phases of this project. If changes in the construction project are proposed, they should be presented to Lumos & Associates, Inc. Geotechnical Department, so that the recommendations provided herein can be reviewed and modified as necessary. As a minimum, final construction drawings should be submitted to the Lumos Geotechnical Department for review prior to actual construction and verification that our geotechnical design recommendations have been implemented. Demolition shall be completed as specified in Appendix D.

---

### ***5.2 General Site Grading***

---

#### **5.2.1 Clearing and Grubbing**

Prior to placement of fill and/or the proposed improvements, the areas to receive fill and/or improvements shall be cleared and grubbed. Clearing and grubbing is not anticipated under the existing roadway. Clearing and grubbing may be required if improvements will be placed outside of the existing roadway. Where required, clearing and grubbing is anticipated to be as much as six (6) inches, or more, where thicker vegetation/roots are present.

Root- or organic-laden soils encountered during excavations, should be stockpiled in a designated area on site for later use in landscaping, or removed off site as directed by the owner. Excavated soils free from any organics, debris or otherwise unsuitable material and with particles no larger than four (4) inches in maximum dimension may be stockpiled and moisture conditioned for later use as compacted fill provided it meets the criteria for structural fill soils.

Exposed excavation surfaces to support any of the proposed improvements should be observed and approved by a Lumos representative. Upon re-compaction and prior to placing any base, the re-compacted surface should be proof-rolled to identify any possible yielding surfaces. Proof-rolling should be conducted with a heavy rubber-tire loader with a fully loaded bucket, or a fully loaded water truck, and observed and approved by a Lumos representative.

### 5.2.2 Unsuitable Subgrade Mitigation

Unstable conditions due to yielding and/or pumping soils may be encountered on site. Additionally, the exposed soils may yield or pump under heavy equipment loads or where vibratory equipment draws up water. If yielding or pumping conditions are encountered, the soils should be scarified in place, allowed to dry as necessary and re-compacted, where applicable. Alternatively, the unsuitable or saturated soil should be removed, the exposed surface leveled and compacted/tamped as much as practical without causing further pumping, and covered (including the sides) with geotextile stabilizing fabric (Mirafi HP370 or other equivalent). The fabric should then be covered with at least twelve (12) inches of four (4) to six (6) inch **angular rock fill** with enough fines to fill the inter-rock pore spaces. Placement should be by end dumping. No traffic or other action should be allowed over the fabric, which may cause it to deflect/deform prior to cobble placement. Test sections should be used to determine the minimum thickness and/or number of layers required for stabilization.

Stabilization should be evaluated by proof-rolling standards commensurate with the equipment used, and approved by a Lumos representative. The placement of the stabilizing rock-fill may require additional over-excavation to maintain appropriate grading elevations. A filter fabric (Mirafi 180N or equal) should also be placed over the cobble rock fill to prevent piping of fines from covering soils into the stabilizing rock matrix.

### 5.2.3 Structural Fill

Properly compacted structural fill soils to be used on site should consist of non-expansive materials (LL less than 35 and/or a PI less than 12 and/or Expansion Index less than 20), have an R-Value of at least 30, should be free of contaminants, organics (less than two percent (2%)), rubble, or natural rock larger than 4 inches in largest dimension. All structural fill soils shall also be non-corrosive and have a water soluble sulfate content of less than 0.1%. Structural fill soils shall also meet the following gradation requirements (Table 2):

**TABLE 2**  
**STRUCTURAL FILL GRADATION**

Sieve Size	% Passing
4"	100
3/4"	70 - 100
#40	15 - 65
#200	5 - 35

Import structural fill soils should be tested and approved prior to being placed or delivered on-site (**seven day advanced notice**).

Prior to placement of structural fill, the site subgrade shall be scarified to a depth of twelve (12) inches, moisture conditioned to within two percent (2%) of optimum, and re-compacted to a minimum of **ninety percent (90%)** as determined by the ASTM D1557 Standard.

Structural fill should be placed only on compacted sub-grade or on compacted fill in loose lifts not exceeding eight (8) inches, moisture conditioned to within two percent (2%) of optimum, and compacted to at least **ninety percent (90%)** relative compaction as determined by the ASTM D1557 Standard. Lift thickness may be increased, at the discretion of the Geotechnical Engineer, provided the contractor can demonstrate that adequate compaction is being achieved.

Fill material should not be placed, spread or compacted while the ground is frozen or during unfavorable weather conditions. When site grading is interrupted by heavy rain or snow, grading or filling operations should not resume until a Lumos representative approves the moisture content and density conditions of the subgrade or previously placed fill.

Landscape areas should be cleared of all objectionable material. In cut areas, no other work is necessary except grading to proper elevation. In landscape areas, fill should be placed in loose lifts not exceeding eight inches and compacted to at least **ninety percent (90%)** relative compaction to prevent erosion.

Water should not be allowed to pond on pavements or adjacent to structures, and measures should be taken to reduce surface water infiltration into the subgrade soils.

A representative of Lumos should be present during site grading operations to ensure any unforeseen or concealed conditions within the site are identified and properly mitigated, and to test and observe earthwork construction. This testing and observation is an integral part of our service as acceptance of earthwork construction and is dependent upon compaction and stability of the subgrade soils. The soils engineer may reject any material that does not meet engineering characteristics, compaction, and stability requirements. Further recommendations of this report are based upon the assumption that earthwork construction will conform to recommendations set forth in this section of the report.

## 6.0 PAVEMENT DESIGN

### 6.1 Pulverization, Cement Treatment, and Asphalt Concrete

Lumos recommends pulverizing the existing asphalt, aggregate base, and/or subgrade soils to a depth of twelve (12) inches. The pavement structural section was determined for the asphalt concrete utilizing a resistance value (R-Value) of 7 (Native Clayey Sand with Gravel) and an R-Value of 80 for the cement treated recycled aggregate base. For this project, we have assumed a Traffic Index (TI) value of 5 due to the anticipated low traffic volume. Refer to Table 3 for the recommended asphalt pavement section. The pulverized material shall meet the gradation requirements of Type 1 Recycled Aggregate Base. The pulverized material shall be regraded to accommodate four (4) inches of asphalt. The remaining eight (8) inches of pulverized material shall be cement treated. The regraded pulverized material shall be moisture conditioned to at least two percent (2%) over optimum, five percent (5%) cement added by dry weight of aggregate, and compacted to a minimum of **ninety-five percent (95%)** relative density of the ASTM D1557 standard. The compacted cement treated pulverized material shall be sealed with a coat of CSS applied at a rate of between 0.15 gallons to 0.25 gallon per square-yard within twenty-four (24) hours of compaction. The cement treated pulverized material shall be kept moist until the cure seal is placed. Following placement of the cure the prepared material shall be allowed to cure for a minimum of seven (7) days or until a minimum compressive strength of at least three-hundred pounds per square inch (300 psi) is achieved (we anticipate a 3 day cure will reach the specified strength). The minimum compressive strength shall be achieved prior to paving. Immediately prior to paving, the cement treated pulverized materials shall be "microcracked", utilizing a vibratory roller. Microcracking shall be completed prior to paving and to the satisfaction of the Geotechnical Engineer. See Appendix C and E for the Pavement Calculations and Cement Treated Specimen Compression Test Data.

**TABLE 3**  
**PULVERIZATION REQUIREMENT AND PAVEMENT SECTION**

Traffic Index	Pulverization Depth	Cement Treated Recycled Base Thickness	Asphalt Thickness
5	12"	8"	4"

\*See Appendix C for the Pavement Calculations

We recommend a Type III, PG64-28NV, 50 blow Marshall mix targeting three percent (3%) air voids. The asphalt concrete shall be compacted to between ninety-three percent (93%) and ninety-eight percent (98%) of the theoretical maximum ("Rice") specific gravity.

All mix designs for asphalt concrete should be submitted to the Geotechnical Engineer for review and approval a minimum of seven (7) days prior to paving.

---

## 7.0 CORROSION AND CHEMICAL ATTACK

---

The on-site soil was tested and has a non-detectable amount of sulfate when evaluated utilizing EPA method 300. However, Type II cement (meeting ASTM C150) is recommended for all concrete in direct contact with on-site soil.

All exterior concrete should have between four and one half and seven and one half percent (4.5%-7.5%) entrained air, a maximum water-cement ratio of 0.45 and comply with all other ACI recommendations for concrete placed in areas subject to freezing. A minimum compressive strength of 4,000 psi is recommended for all external concrete. All concrete shall be placed pursuant to ACI recommendations.

---

## 8.0 CONSTRUCTION SPECIFICATIONS

---

All work shall be governed by the latest adopted revision of the Standard Specifications and Standard Details for Public Works Construction, as distributed by The City of Sparks, except as modified herein.

---

## 9.0 LIMITATIONS

---

This report has been prepared in accordance with the currently accepted engineering practices in Northern Nevada. The analysis and recommendations in this report are based upon exploration performed at the locations shown on the site plan, the proposed improvements as described in the Introduction section of this report and upon the property in its condition as of the date of this report. Lumos makes no guarantee as to the continuity of conditions as subsurface variations may occur between or beyond exploration points and over time. Any subsurface variations encountered during construction should be immediately reported to Lumos so that, if necessary, Lumos' recommendations may be modified.

This report has been prepared for and provided directly to the City of Sparks ("The Client"), and any and all use of this report is expressly limited to the exclusive use of the Client. The Client is responsible for determining who, if anyone, shall be provided this report, including any designers and subcontractors whose work is related to this project. Should the Client decide to provide this report to any other individual or entity, Lumos shall not be held liable for any use by those individuals or entities to whom this report is provided. The Client agrees to indemnify, defend and hold harmless Lumos, its agents and employees from any claims resulting from unauthorized users.

If this report is utilized in the preparation of an Engineer's Estimate of Probable Construction Costs, then the preparer of the estimate acknowledges that the report recommendations are based on the subsurface conditions found at the specific locations investigated on site; that subsurface conditions may vary outside these locations; and that no guaranty or warranty, express or implied, is made that the conditions encountered are representative of the entire site. The preparer of the estimate agrees to indemnify, defend and hold harmless Lumos & Associates, its agents and employees from any and all claims, causes of action or liability arising from any claims resulting from the use of the report in the preparation of an Engineer's Cost Estimate.

This report is not intended for, nor should be utilized for, bidding purposes. If it is utilized for bidding purposes, Client acknowledges that the report recommendations are based on the subsurface conditions found at the specific locations investigated on site; that subsurface conditions may vary outside these locations; and that no guaranty or warranty, express or implied, is made that the conditions encountered are representative of the entire site. The Client agrees to indemnify, defend and hold harmless Lumos & Associates, its agents and employees from any and all claims, causes or action or liability arising from any claims resulting from the use of the report for bidding purposes.

As explained above, subsurface variations may exist and as such, beyond the express findings located in this report, no warranties express, or implied, are made by this report. No affirmation of fact, including but not limited to statements regarding suitability for use of performance shall be deemed to be a warranty or guaranty for any purpose.

## PAVEMENT DESIGN

Job Number: 11800.120  
Project: City of Sparks FY25 Rehabilitation  
Description: Pavement Calculations  
By: J. Macaluso

R-Value for CTB = 80 (Assumed)  
R-Value for Native Clayey Sand with Gravel = 7  
TI (Local Road) = 5 (Light Traffic)

$$GE = 0.0032 * (TI) * (100 - R)$$

$$Gf_{(AC, Local)} = 2.5, Gf_{(Cement Treated Soil)} = 1.2, Gf_{(subgrade)} = 1$$
$$t_{layer} = GE / Gf$$

**Local Road Pavement Section : Asphalt and Cement Treated Recycled Material**

$$GE_{AC} = 0.0032 * (5) * (100 - 80) = 0.32'$$
$$t_{AC} = (0.32 / 2.5) * (12" / 1') = 1.54" \quad \text{USE 4" Asphalt Concrete}$$
$$GE_{AC} = (4" * 2.5) / (12") = 0.83'$$

$$GE_{CTB(Pulv.)} = 0.0032 * (5) * (100 - 7) = 1.49'$$
$$t_{CTB(Pulv.)} = ((1.49' - 0.83') / 1.2) * (12" / 1') = 6.6" \quad \text{USE 8" Cement Treated Pulverized Material}$$

# **APPENDIX D**

## **SPECIFICATIONS FOR DEMOLITION**

## SPECIFICATIONS FOR DEMOLITION

Demolition shall include the removal of all designated structures/improvements to be removed, i.e. concrete structures, asphalt pavements, utilities, pipes and unsuitable material within the project area. Excavations caused by removal of existing improvements and utilities shall be cleared of all wastes, debris, and any loose/soft soils, and backfilled with properly compacted fill, as specified under the General Site Grading section of this report. All fill compaction should be performed under observation and testing by the Geotechnical Engineer.

Broken concrete, asphalt, and other materials shall be considered waste and shall be removed from the site.

Any existing drain lines, wires, utilities, etc., which are to remain on the site shall be protected from damage. Buried drain lines, pipe conduits, utilities, etc. which are necessarily cut shall be either carefully and permanently capped at the property line as specified by the City Engineer or re-routed as necessary. Utility lines not specifically noted for disposition, but which are encountered in the work area shall be capped, extended, protected or re-routed as necessary for completion of the work, as directed.

All work shall be performed in accordance with the Federal Occupational Safety and Health Administration, the local Division of Occupational Safety and Health requirements, and applicable ordinances of the governing municipality.

Care shall be taken not to damage adjoining utilities or structures to remain after completion of the work. Finished work damaged by operations during demolition and site preparation shall be repaired or replaced to the satisfaction of the Owner at no cost to the Owner.

All materials resulting from demolition and site preparation not designated by the Owner to be recovered or to be relocated by the Contractor shall be removed promptly and disposed of off the site.

Upon completion of demolition and site preparation, the site shall be "raked clean" – if applicable – and all waste, rubble, debris, etc. shall be removed and disposed of off the site.
